

USER INTERFACE DESIGN PROJECT

Discord Clone Frontend

A responsive recreation of Discord's marketing website using HTML5, CSS3, and JavaScript.

Repository	github.com/P-VARUN/Discord-Clone-Frontend
Live Demo	discord-clone-frontend-plum.vercel.app
Submitted By	PALERU VARUN AV.SC.U4CSE25138
Course	User Interface Design (23CSE113), SEM-2
Submitted To	Dr. Rajkumar Batchu, Assistant Professor, CSE
Document Date	29 May 2026

Project Summary

The project focuses on visual accuracy, responsive layout, interaction polish, and asset-rich presentation. It recreates Discord's public landing experience with a full hero section, dropdown navigation, animated feature areas, media panels, responsive mobile navigation, and a detailed footer.

Figure 1.

1. Introduction

Discord Clone Frontend is a static frontend project built to recreate the visual style and interaction flow of Discord's official marketing website. The work is positioned as a User Interface Design assignment and emphasizes layout fidelity, responsive behavior, animation, and user-facing polish.

The application does not implement Discord's real communication backend. Instead, it concentrates on the public landing page experience: navigation, calls to action, hero artwork, feature showcases, video media, mobile menus, and footer navigation.

2. Objectives

- Recreate a modern Discord-style landing page with strong visual similarity and clear content hierarchy.
- Build a responsive interface that adapts across mobile, tablet, and desktop screen sizes.
- Use core web technologies without a frontend framework, keeping the project easy to run and inspect.
- Add interactive behavior such as dropdown menus, mobile navigation, footer accordions, scroll effects, and media panels.
- Practice UI design principles including spacing, typography, color consistency, visual balance, and motion.

3. Technology Stack

Technology	Role in Project	Evidence in Repository
HTML5	Defines page structure, navigation, hero, feature sections, CTA area, footer, and mobile drawer.	index.html
CSS3	Handles layout, custom properties, gradients, responsive breakpoints, animations, and visual styling.	style.css
JavaScript	Adds dropdowns, scroll reactions, mobile menu behavior, parallax movement, and footer accordions.	script.js
Media Assets	Provides artwork, icons, webp images, PNG images, and MP4 feature previews.	assets/ folder
Vercel	Hosts the live demo referenced in the README.	discord-clone-frontend-plum.vercel.app

4. Project Structure

index.html	Main page markup containing desktop navigation, hero content, six feature sections, bottom CTA, footer, and mobile drawer markup.
style.css	Main stylesheet containing CSS variables, layout rules, media queries, animation keyframes, responsive behavior, and visual effects.
script.js	JavaScript file containing event handling for dropdowns, mobile navigation, scroll-based states, parallax effects, and footer accordion behavior.
assets/	Image, video, favicon, robot artwork, hero visuals, and feature media used throughout the landing page.
README.md	Project overview, live demo link, technology stack, setup steps, contribution note, contact information, and assignment metadata.

5. Main Features

Responsive Navigation

The project includes a desktop navigation bar with dropdown groups for Safety, Quests, Support, Blog, and Developers. On smaller screens, the interface switches to a mobile menu drawer with expandable submenu sections.

Motion and Interaction

The JavaScript layer adds hover dropdowns with a backdrop, a scroll-aware logo and navbar state, parallax movement for feature boxes, mobile drawer open and close handling, mobile submenu toggles, and footer accordions for compact screens.

6. Design Approach

The visual direction follows Discord's playful public-brand language: rounded shapes, bold hero text, bright blurple accents, layered artwork, rich background imagery, and animated feature panels. The layout uses large visual sections to create an immersive landing page rather than a dense application dashboard.

- **Typography:** uses web-friendly sans-serif families including Inter, Helvetica, Arial, and Montserrat-like display treatment.
- **Color:** uses Discord-like blurple, white, black, gray, and gradient-heavy feature sections.
- **Layout:** combines flexbox, grid-style structures, absolute positioning, and responsive breakpoints.
- **Media:** relies on WebP artwork, PNG supporting images, and MP4 video previews for a rich marketing-page feel.

- Responsiveness: includes breakpoints at desktop, tablet, and mobile widths, with specific handling below 1100px, 768px, and 500px.

7. Setup and Usage

1. Clone the repository from <https://github.com/P-VARUN/Discord-Clone-Frontend.git>.
2. Open the project folder in a code editor such as Visual Studio Code.
3. Open index.html directly in a browser, or run it through the Live Server extension for a smoother local preview.
4. For desktop/laptop viewing, keep browser zoom at 100 percent for the best visual match, as noted in the README.
5. Test the page across desktop, tablet, and mobile widths to verify navigation, layout, and responsive behavior.

8. Learning Outcomes

- Improved understanding of semantic page structure and how a marketing website is organized.
- Practical experience with responsive CSS, media queries, flexible layouts, and mobile-first adjustments.
- Hands-on use of CSS animations, keyframes, gradients, background images, and layered positioning.
- Experience writing JavaScript for UI behavior without relying on external frameworks.
- Practice translating a real product website into an educational frontend implementation.

9. Limitations

- The project is frontend-only and does not include real authentication, chat, voice, server, or messaging functionality.
- Some layout behavior depends on exact viewport and zoom conditions, especially on desktop where the README recommends 100 percent zoom.
- Inline SVGs and decorative media increase visual fidelity but can make the HTML file longer and harder to maintain.
- The project uses vanilla files rather than a component system, so future scaling would benefit from better modular organization.

10. Conclusion

Discord Clone Frontend is a strong UI-focused educational project because it demonstrates practical HTML, CSS, and JavaScript skills through a familiar, visually demanding website. Its strengths are the rich media presentation, responsive navigation, animated feature sections, and close attention to Discord's public landing-page aesthetic. With additional accessibility, performance, and maintainability improvements, it could become an even cleaner portfolio-quality frontend case study.
